

Press Release HL-Cont PLUS
October 2015

HAMANN AG, Hollenstedt

New smallest Waste Water Treatment Plant without Membrane

As from 1st January, 2016 the IMO Standard Rule MEPC.159(55) for waste water treatment onboard vessels will be replaced by the new Standard Rule MEPC.227(64).

HAMANN AG, Hollenstedt (Germany) one of the leading companies for waste water treatments have now developed the smallest on board plant Type "HL-CONT Plus" which has already been certified according to MEPC.227(64), and is called

HL-CONT Plus 0125.

Compared to its efficiency this system is an extremely small and light version.

The HL-CONT Plus 0125 has a capacity of 3 t per day. It is particularly suitable for installation in small spaces and for retrofits due to its modular and dismantlable design.

One characteristic of HL-CONT Plus series is: It works without filter and membrane. The main advantage is a constant flow rate without any danger of blocking. The long lasting proven technology stands for hardly any maintenance – contrary to the extensive maintenance of filter/membrane systems – which results in lower expenses as well as clean hands for operators/crew on board.

Additional benefits are the self-cleaning mode without aggressive chemicals, low energy consumption and the use of high quality and robust materials and components.

For over forty years HAMANN AG manufactures high quality maritime waste water systems with capacities between 3 and 192t per day. Every unit is 100 % "Made in Germany" and handmade according to highest industrial standards.

Innovative designs and patented methods of treatment even convinced the very critical shipping industry. All waste water systems of HAMANN AG have been certified according to the present IMO Standard Rule MEPC.159(55) and the future IMO Standard Rule MEPC.227(64).
